

Nasals

Tasks

1. Write a function `lacks_nasals` which takes a single `str` as input, representing a single word. It should return `True` if the word is free of nasals, in this case defined as the letters *m* and *n*. If there are any nasals present, it should return `False`.
2. Write a function `any_nasals` which takes a list of `str` objects as input, representing a list of words. It should return `True` if *any* of the words *contains* nasals, otherwise `False`. You **must** call the function `lacks_nasals` in this function.

Example

```
In [1]: import phonology
```

```
In [2]: phonology.lacks_nasals("amazing")
```

```
Out[2]: False
```

```
In [3]: phonology.lacks_nasals("leaves")
```

```
Out[3]: True
```

```
In [4]: phonology.any_nasals(["beet", "root"])
```

```
Out[4]: False
```

```
In [4]: phonology.any_nasals(["scam", "letter"])
```

```
Out[4]: True
```
