

Censoring text

Task

Write a function `censor` that takes two arguments:

1. A `str` representing a sentence with space-separated tokens
2. A set containing `str` objects, each representing a forbidden word

The function should return a `str` that contains the input sentence with any forbidden words removed. Tokens should be space-separated here as well.

Put your code in the file `simple.py`.

Examples

```
In [1]: import simple
```

```
In [2]: simple.censor("I have a stupid teacher", {"dumb", "stupid"})
```

```
Out[2]: 'I have a teacher'
```
