

Documentation

1. Audiences

There are two main audiences for your code documentetation:

- ▶ Those who are going to use your functions, methods, classes and scripts.
- ▶ Those that are going to maintain your code.

In both cases, that can be yourself in the future.

2. Documentation

```
1  """A program for doing age-related calculations
2  """
3
4  def get_age(year_born, current_year):
5      """Get the age a person will turn this year.
6
7      Args:
8          year_born (int): The year the person is born.
9          current_year (int): The current year.
10
11      Returns:
12          int: The age that the person turns this year.
13      """
14      return current_year - year_born # The age you turn
```

Provide:

- ▶ General info of the content of your program
- ▶ Info of what each function does
- ▶ The arguments to the function (including their data types)
- ▶ What the function returns (including data types)
- ▶ If there is some programming logic in your program that is extra difficult to understand and needs to be explained, add a comment about that

► General info of the content of your program

```
1 """A program for doing age-related calculations
2 """
```

► Info of what each function does

```
1 """Get the age a person will turn this year.
```

► The arguments to the function (including their data types)

```
1 Args:
2     year_born (int): The year the person is born.
3     current_year (int): The current year.
```

► What the function returns (including data types)

```
1 Returns:
2     int: The age that the person turns this year.
```

- ▶ If there is some programming logic in your program that is extra difficult to understand and needs to be explained, add a comment about that

```
1 return current_year - year_born # The age you turn
```
