

Identifying the un-X-able

Task

Write a function that identifies words of the pattern *un-X-able*, for instance *unimaginable* and *undesirable*.

The function should be named `is_un_able` and take as only argument a `str` containing the word. It should return `True` if and only if the word is of the specified form. As a special case, it should return `False` for the word “unable”.

Put the code in the file `english.py`.

Hint: use the `endswith` and `startswith` string methods.

Example

```
import english
print(english.is_un_able("unimaginable"))
print(english.is_un_able("unable"))
print(english.is_un_able("uncertain"))
print(english.is_un_able("miserable"))

def is_un_able(str):
    if word == "unable"
        return False
    if word.startswith("un") and word.endswith("able"):
        return True
    return False
```

should print `True` for the first case only, then `False` for the rest.
