

Initial reduplication

Task

Write a function `initial_reduplication` which takes two arguments:

1. a str containing a word
2. an int specifying how many initial characters should be reduplicated

The function returns a str consisting of the input word with the specified number of characters reduplicated in the beginning of the word.

Put the code in the file `morphology.py`.

Example

```
import morphology
print(morphology.initial_reduplication("ηαηαη", 2))
```

should print *ηαηαηαη*.

Reading

- PY4E chapter 6

```
def initial_reduplication(word,number):
    initial=word[:number]
    result=initial+word
    return result
```
