

Swedish verb lemmatizer

Task

Write a simple lemmatizer that can handle most regular Swedish verbs. To do this, simply replace the suffixes *-ar* (present), *-ade* (past) and *-at* (supine) with the suffix *-a* (infinitive). In case the word has some other suffix, it should be returned unchanged.

Implement the lemmatizer as a function `lemmatize_regular_verb` that takes a single `str` argument, and returns a `str` containin the lemma.

Put your solution in the file `swedish.py`.

Example

```
import swedish
for verb in ["äter", "ritade", "letat", "gå", "i"]:
    print(swedish.lemmatize_regular_verb(verb))
```

Should print the following forms: *äter*, *rita*, *leta*, *gå*, *i*.

```
def lemmatize_regular_verb(str):
    if str.endswith(ar):
        return str[:-2]+"a"

    elif str.endswith(ade):
        return str[:-3]+"a"
    elif str.endswith(at):
        return str[:-2]+"a"

    else:
        return str
```
