

Turkish plurals

In Turkish the plural is formed by adding either *-ler* or *-lar* to the word. The choice of the suffix depends on the last vowel in the word (in phonology the phenomenon is known as vowel harmony):

- if the final vowel is “a”, “ı”, “o” or “u”, *-lar* is used
- if the final vowel is “ä”, “i”, “ö”, “e” or “ü”, *-ler* is used

Task

Write a function `plural_words`, which takes a list of `str` representing Turkish nouns. It should return a corresponding list, but where each noun is in the plural.

Hint: it is easier to solve this exercises if you first write a function like `plural_word` which takes a single noun and returns its plural as a string. The point here is to practice factoring code into separate functions. When writing `plural_word`, the most challenging part is to make sure that you find the last vowel. There are two reasonable approaches: iterating backwards through the string, or reversing the string and iterating forwards through it. You may find that making a separate function to find the last vowel further simplifies your code.

Put your code in the file `turkish.py`.

Example

```
In [1]: import turkish
```

```
In [2]: turkish.plural_words(["deve", "aslan"])  
Out[2]: ['develer', 'aslanlar']
```
